## 01.24 - Preparation of Enteral Feedings (Adult and Pediatric)

Purpose

Topic:

To prevent the ingestion of contaminated liquid feedings that could result in illness either through infection or intoxication.

Audience

All employees of UTMB hospitals, clinics, outpatient surgical center, contract workers, volunteers, and students involved in enteral feedings.

Physical Facility

- All enteral feedings must be prepared in a specific location that encourages the use of aseptic technique and ensures the delivery of safe enteral feedings.
- A handwashing facility must be in close proximity to the enteral feeding preparation area. Hands must be washed or an alcohol hand rub applied to the hands prior to preparing formula.

Preparation and Handling Procedure

- Preparation and Gather supplies.
  - Check manufacturer's expiration date before using.
  - Wash hands or apply an alcohol hand rub to the hands and wear gloves.
  - Wash the top of the can with soap and water before preparing formula.
  - Cover open cans securely with a clean cover before refrigerating.
  - Use aseptic no-touch technique when measuring and placing feeding tube.
  - Use sterile water to add to liquid concentrate formula or to reconstitute powder formula.
  - All equipment and utensils (i.e., measuring spoons, can openers) used in the preparation of formula must be properly cleaned with soap and water between batches.
  - Medications should not be added during preparation of formula.
     Medications may be added at the bedside or at feeding time.
  - Formula bags must be labeled with:
    - Patient name
    - Medical record number
    - Formula name
    - Expiration date and time

•

Storage of Formula / Feedings

- Containers should be stored in a cool dry area when not in use.
- Once opened, canned, ready-to-feed formula must be used immediately and not stored at the bedside or in the refrigerator.
- Reconstituted or diluted formula should be used immediately, Unused formula must be refrigerated in a new food safe container that can be

screw capped. Refrigerated formula label to include formula name, expiration date and time. discard the formula after 24 hours

- Formulas must not be frozen since freezing may cause irreversible physical changes.
- Opened powdered formulas may be stored in a closed container according to manufacturer expiration date or up to 4 weeks (30 days). The date of opening should be written on the container, and it should be stored in a cool dry area when not in use.
- Modulars products in the adult patient population (protein, fat, fiber) should not be added to enteral formula, but administered via feeding tube per product instructions in prescribed amounts and frequency.

## Hang Time of Feeding

- Open enteral feeding system, reconstituted formula must be delivered to the patient within 4 hours of preparation for neonates, pediatric and adult patients.
- Open system, ready to use formula hang time of 8 hours for adult and pediatric patients.
- Refillable sets (bag and tubing) must be replaced at 24 hours.

## **Definitions**

- Open enteral feeding system—uses formula from tetra-paks or bottles which are poured into a feeding bag or syringe
- Closed enteral feeding system—a sterile container of prefilled formula that is ready to administer to the patient and is spiked with an administration set
- Reconstituted formula—powder formula that requires reconstitution with water
- Modular product—single nutrient products such as protein powders, MCT oil, fiber used to fortify nutrition regimens.
- Ready to Hang formula—enteral formulas packaged in sealed bags or containers that require no manipulation prior to use in a closed enteral feeding system
- Ready to use formula—enteral formulas that require no reconstitution prior to adding to refillable administration sets in an open feeding system
